. . day, and the decoder online is updated more often than the one on our website. A: Arytano's answer is correct, but I'd like to add a little more explanation. The original mechanism of IonCube was intended to protect against someone "hacking" an application and then reverse-engineering it (finding the encryption and/or decompression functions and removing them). The company that created the IonCube technology made their money by selling the decoder and related technologies. Since that time they have improved the technology such that a single attacker cannot decompress a system. When you are decompressing a file, you are basically in a race. If you are fast enough, then your decryption routine will be faster than the person writing the code that you are trying to protect. This means that your code will have to be compiled (or whatever other means the attacker uses) before the decoder routine is available to run. The hope is that you'll have enough time to write the code. However, if the attacker's decoder is significantly faster, then you're out of luck. In that case, I suggest looking into ways to compile your code ahead of time. Or, if you're dealing with software that is very popular, look at ways that you can use a hardware acceleration (GPU) for decryption. Media playback is unsupported on your device Media caption Public spending and protest on the streets of the Chinese city of Chengdu Activists have thrown tomatoes at a Communist Party official in Chengdu, the capital of Sichuan province. A video posted online showed the man being struck by the fruit and holding up his hands to stop it. The official had been speaking at a rally, where tens of thousands of people had gathered to demand an investigation into a local government official who had been arrested on allegations of corruption. A video shows the man shouting to police to "show respect to the people's will" and asking them to "know how to handle demonstrations". The official was seen to be surrounded by a crowd shouting slogans and waving national flags. The student, who was identified only by his surname Zhang, described the incident on Weibo, a Twitter-like microblogging platform, as a "big country versus a small county" incident. "The man being addressed by us was the head of Chengdu municipal propaganda affairs department," he said. "We decided to throw tomatoes because we 82157476af
